

Example 1

A 10 kg block is pushed across the floor with a 50 N horizontal force. The force of friction between the block and the floor is 30 N.

- (a) What is the net force acting on the box?
- (b) What is the acceleration of the box?

$$\begin{aligned} \text{(a)} \quad F_{\text{net}} &= F_p - F_f \\ &= 50\text{N} - 30\text{N} \\ \underline{F_{\text{net}} &= 20\text{N}} \end{aligned}$$

$$\begin{aligned} \text{(b)} \quad F &= ma \\ 20\text{N} &= (10\text{kg})a \\ \underline{a &= 2 \text{ m/s}^2} \end{aligned}$$

Example 2

A snowblower is pushed with a 65 N force at an angle of 37° with the horizontal. The snowblower is moving with a constant velocity. Calculate the force of friction acting on the snowblower.

$$F_{\text{net}} = 0$$

$$F_p \cos 37 - F_f = 0$$

$$65 \cos 37 - F_f = 0$$

$$\underline{F_f = 52 \text{ N}}$$

Example 3

Three people, labeled A, B, and C, are pulling on a sled as shown. Calculate the net force on the sled.

X

$$-F_B \cos 30 - F_C \cos 60 + F_A$$

$$-20 \cos 30 - 50 \cos 60 + 30$$

$$-12.32 \text{ N}$$

Y

$$F_B \sin 30 - F_C \sin 60$$

$$20 \sin 30 - 50 \sin 60$$

$$-33.3 \text{ N}$$

$$F_{\text{net}} = \sqrt{33.3^2 + 12.32^2}$$

$$= 35.5 \text{ N}$$

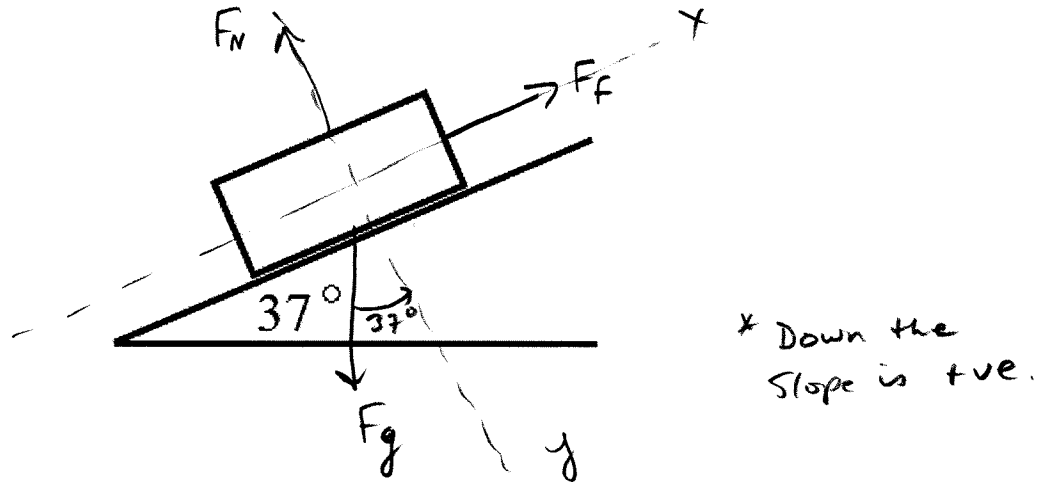

$$\tan \theta = \frac{33.3}{12.32}$$

$$\theta = 69.7^\circ$$

$$F_{\text{net}} = 35.5 \text{ N } 69.7^\circ \text{ S of W}$$

Example 4

A 5.0 kg block is stationary on an incline plane as shown. Calculate the force of friction acting on the block.

$$\begin{aligned} \text{X} \\ F_g \sin 37 - F_f &= 0 \\ m g \sin 37 - F_f &= 0 \\ (5 \text{ kg}) (9.8 \text{ m/s}^2) \sin 37 &= F_f \end{aligned}$$

$$\begin{aligned} \text{Y} \\ -F_g \cos 37 + F_N &= 0 \end{aligned}$$

$$\underline{F_f = 29.5 \text{ N}}$$

Example 5

A horizontal force of 400.0 N is required to pull a 1760 N trunk across the floor at constant speed. Calculate the coefficient of sliding friction.

$$F_g = 1760 \text{ N}$$

$$\begin{array}{l} \underline{x} \\ -F_f + 400 = 0 \\ F_f = 400 \text{ N} \end{array}$$

$$\begin{array}{l} \underline{y} \\ F_N - F_g = 0 \\ F_N - 1760 \text{ N} = 0 \\ F_N = 1760 \text{ N} \end{array}$$

$$F_f = \mu F_N$$

$$400 = \mu (1760)$$

$$\underline{\mu = 0.23}$$

Example 6

A 65 N boy sits on a sled weighing 52 N on a horizontal surface. The coefficient of friction between the sled and the snow is 0.012. The sled is pulled at constant speed by a rope held horizontally. What is the tension (the pull) in the rope?

$$F_g = 65\text{ N} + 52\text{ N} = 117\text{ N}$$

$$\begin{array}{c} \underline{x} \\ -F_f + F_T = 0 \end{array}$$

$$F_T = F_f$$

$$\begin{array}{c} \underline{y} \\ F_N - F_g = 0 \\ F_N = 117\text{ N} \end{array}$$

$$\begin{aligned} F_f &= \mu F_N \\ &= 0.012 (117\text{ N}) \\ &= 1.4 \end{aligned}$$

$$\underline{F_T = 1.4\text{ N}}$$

Example 7

A 20 kg block (A) rests on a frictionless table; a cord attached to the block extends horizontally to a pulley at the edge of the table and a 10 kg mass (B) hangs at the end of the cord.

- (a) Calculate the acceleration of the block and mass.
- (b) Calculate the tension in the cord.

(a) only force is due to gravity. on B
 $F = mg = (10 \text{ kg})(9.8 \text{ m/s}^2) = 98 \text{ N}$

both A + B accelerate under this force.

$$F = ma$$

$$98 \text{ N} = (20 \text{ kg} + 10 \text{ kg}) a$$

$$\underline{a = 3.3 \text{ m/s}^2}$$

(b)

Force of tension can be found by isolating block A

$$F = ma$$

$$F_T = (20 \text{ kg})(3.3 \text{ m/s}^2)$$

$$\underline{F_T = 66 \text{ N}}$$

Example 8

A 20 kg block (A) rests on a table; a cord attached to the block extends horizontally to a pulley at the edge of the table and a 10 kg mass (B) hangs at the end of the cord. The coefficient of friction between block A and the table is 0.12.

Calculate the acceleration of block A.

$$F_g = mg = (10 \text{ kg})(9.8 \text{ m/s}^2) = 98 \text{ N}$$

$$F_p - F_f = ma$$

$$98 - 23.52 = (20 + 10)a$$

$$\underline{a = 2.48 \text{ m/s}^2}$$

$$F_f = \mu F_N$$

$$F_f = 0.12(196 \text{ N})$$

$$= 23.52 \text{ N}$$

since friction only acts on block A

$$F_N = mg = (20 \text{ kg})(9.8 \text{ m/s}^2) = 196 \text{ N}$$
